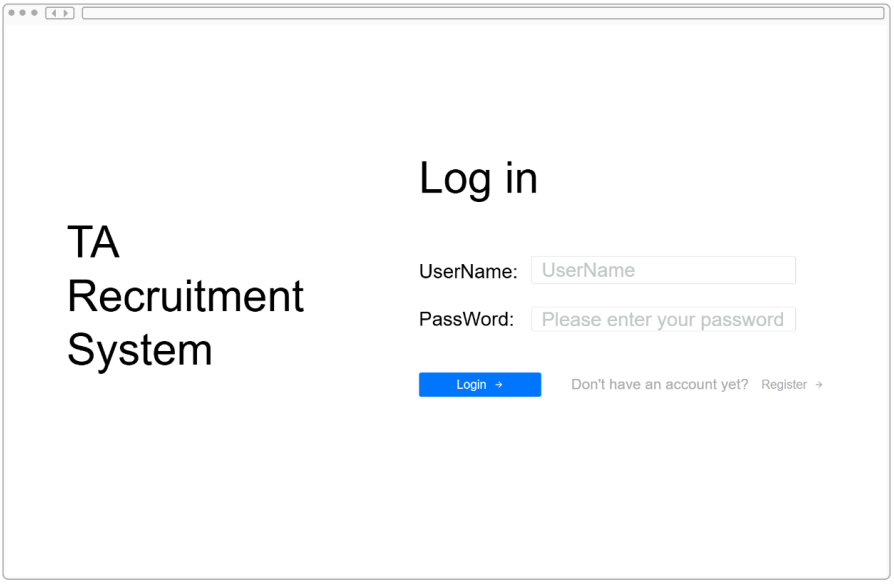
UI/UX Specification for TA Recruitment System

Group 56

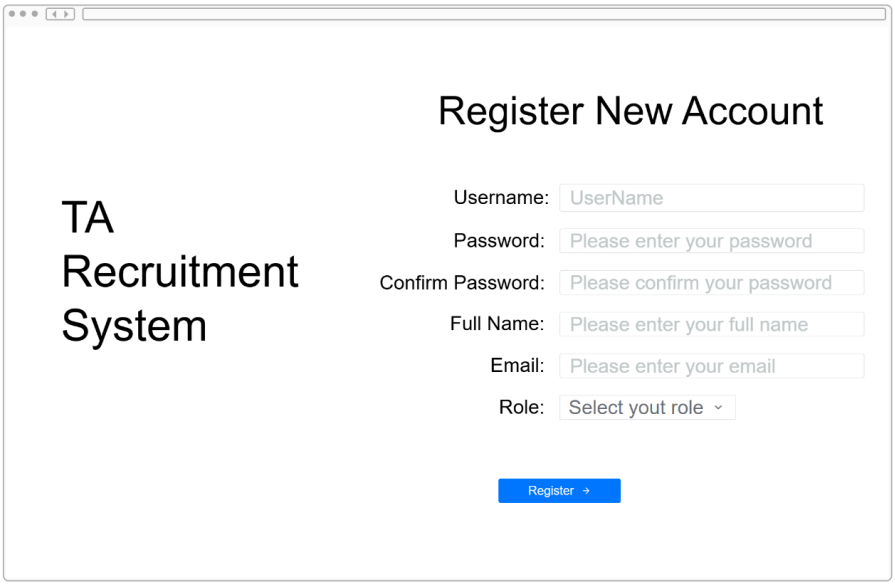
March 22, 2026

1 Authentication Module



1.1 Log in Screen

- **Purpose:** The central entry point for all user roles (TA, MO, and Admin) to securely access the system.
- **UI Elements:**
  - Standard text input fields for `UserName` and `PassWord`.
  - A primary call-to-action (CTA) button: `Login` →.
  - A secondary navigation link: `Register` → for new users.
- **User Flow:** The system authenticates the credentials against the stored user data (which will be in plain text, CSV, or JSON format) and routes the user to their respective role-based dashboard.



1.2 Register New Account Screen

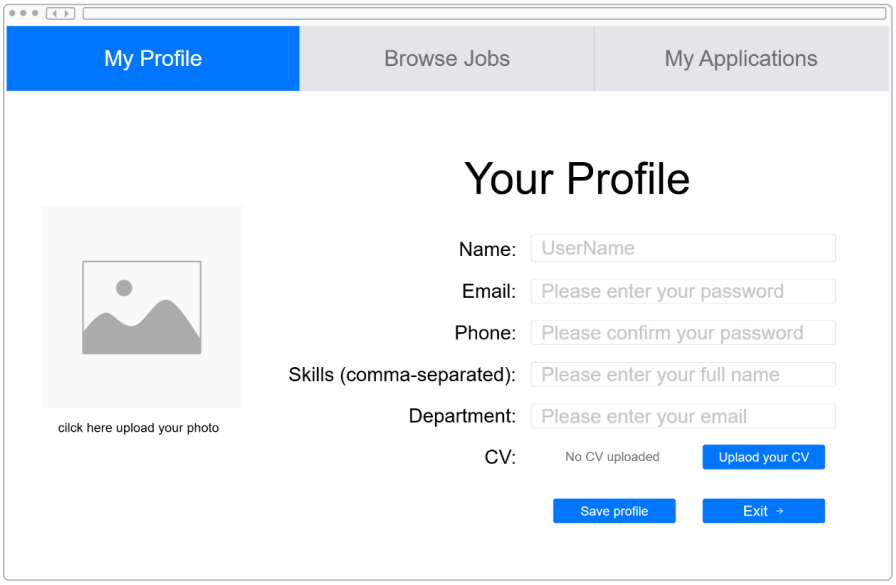
- **Purpose:** Allows new users to create an account and define their system permissions.
- **UI Elements:**
  - Input fields: `Username`, `Password`, `Confirm Password`, `Full Name`, `Email`.
  - A dropdown menu for `Role` selection (TA, MO, Admin).
  - A primary CTA button: `Register` →.
- **User Flow:** Upon successful validation (e.g., passwords match), the system creates a new profile record.

2 Teaching Assistant (TA) Workspace

This workspace fulfills the core requirement that a TA can manage their profile, find jobs, and track applications. It uses a clean, tabbed navigation structure.

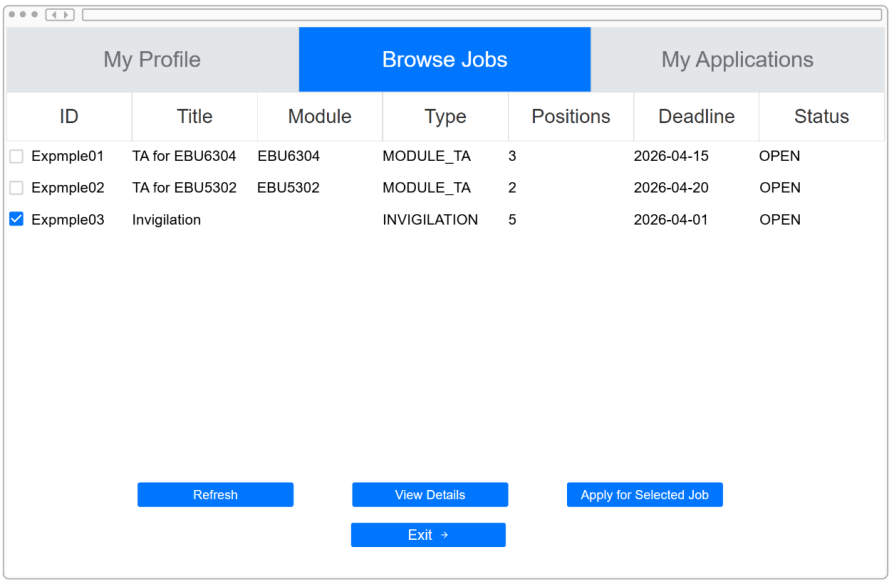
2.1 My Profile Tab

- **Purpose:** Allows the TA to create and update their applicant profile.
- **UI Elements:**
  - An image placeholder for uploading a profile photo.
  - Data entry fields: `Name`, `Email`, `Phone`, `Skills (comma-separated)`, and `Department`.
  - A `CV` upload section displaying the current upload status ("No CV uploaded") and an `Upload your CV` button.
  - Action buttons: `Save profile` and `Exit` →.



- **Design Note:** Asking for comma-separated skills is a smart technical decision here, as it makes it much easier to parse and save the data into simple text file formats like CSV or JSON without requiring a complex database structure.

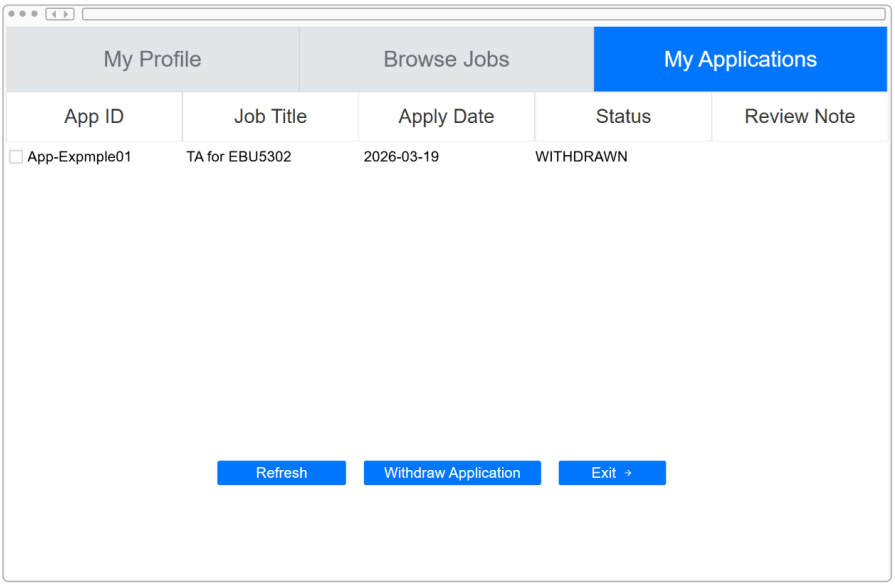
2.2 Browse Jobs Tab



- **Purpose:** Enables TAs to view available positions and submit applications.
- **UI Elements:**
  - A data table displaying open positions with columns for `ID`, `Title`, `Module`, `Type` (e.g., MODULE_TA, INVIGILATION), `Positions`, `Deadline`, and `Status`.
  - Checkbox selectors on the left of each row to select a specific job.
  - Action buttons: `Refresh`, `View Details`, and `Apply for Selected Job`.

- **User Flow:** The TA browses the list, selects a job via the checkbox, and clicks apply, which generates a new application record linked to their ID.

2.3 My Applications Tab



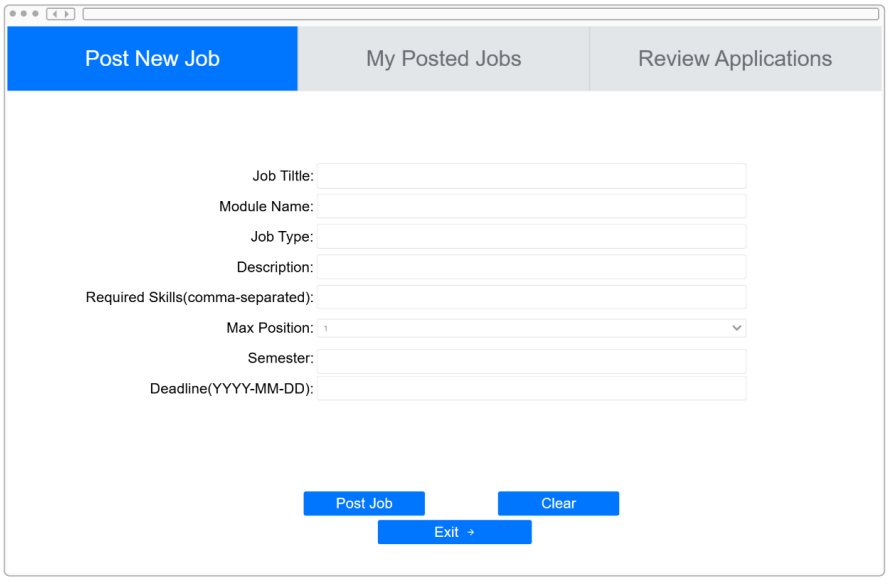
- **Purpose:** Allows the TA to check their application status.
- **UI Elements:**
  - A data table summarizing applications with columns for `App ID`, `Job Title`, `Apply Date`, `Status` (e.g., WITHDRAWN, PENDING, ACCEPTED), and `Review Note`.
  - Checkbox selectors for row manipulation.
  - Action buttons: `Refresh`, `Withdraw Application`, and `Exit` →.

3 Module Organiser (MO) Workspace

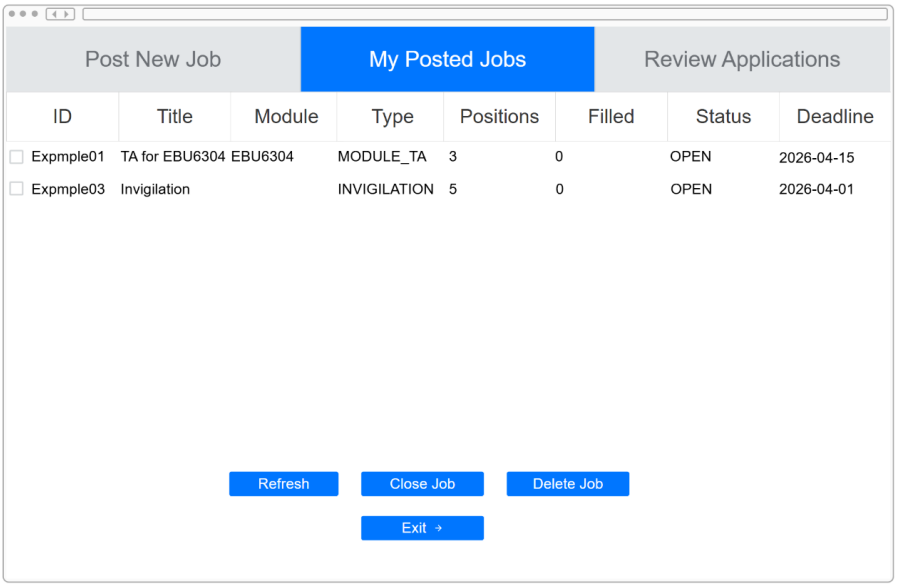
This workspace provides the tools necessary for module organizers to recruit TAs and manage their postings.

3.1 Post New Job Tab

- **Purpose:** Provides a form for MOs to create new job opportunities.
- **UI Elements:**
  - Input fields: `Job Title`, `Module Name`, `Job Type`, `Description`, `Required Skills (comma-separated)`, `Max Position` (dropdown), `Semester`, and `Deadline (YYYY-MM-DD)`.
  - Action buttons: `Post Job`, `Clear`, and `Exit` →.
- **Design Note:** The strict date format enforcement (YYYY-MM-DD) is excellent for maintaining data consistency when reading and writing to plain text files.



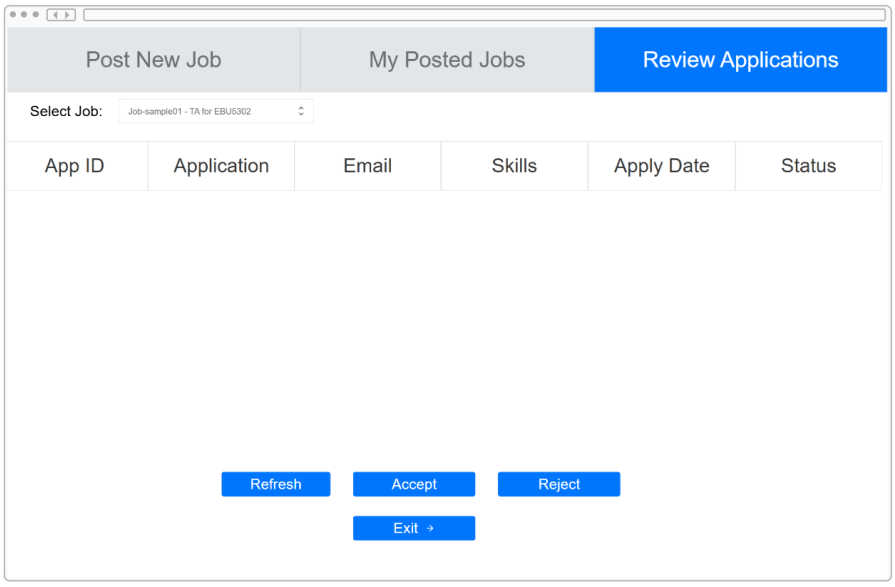
3.2 My Posted Jobs Tab



- **Purpose:** A dashboard for MOs to monitor the jobs they have created.
- **UI Elements:**
  - A data table showing `ID`, `Title`, `Module`, `Type`, `Positions`, `Filled`, `Status`, and `Deadline`.
  - Action buttons: `Refresh`, `Close Job`, `Delete Job`, and `Exit` →.
- **User Flow:** The MO can quickly glance at the `Filled` versus `Positions` columns to gauge recruitment progress.

3.3 Review Applications Tab

- **Purpose:** Enables MOs to evaluate candidates and select applicants for jobs.

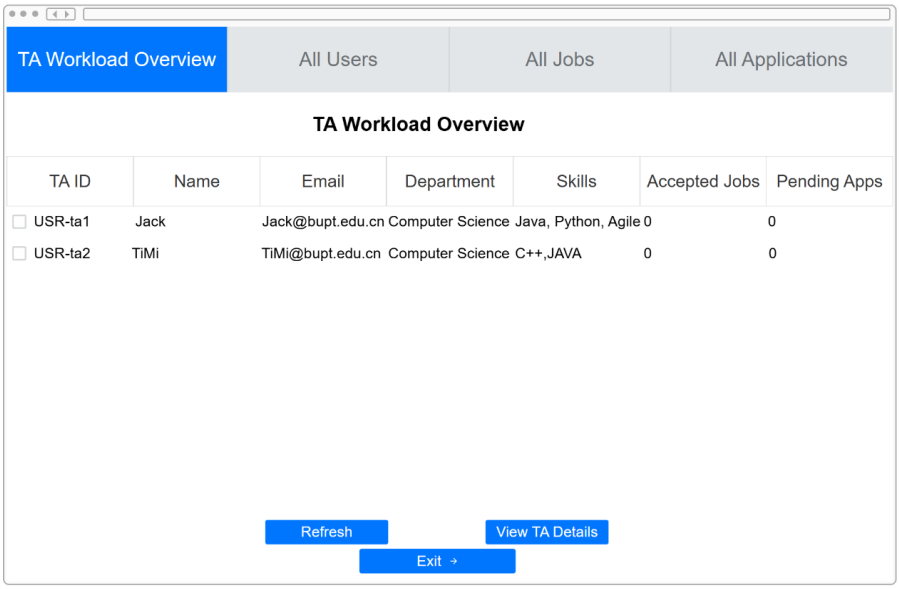


- **UI Elements:**
  - A `Select Job` dropdown menu to filter applications by a specific posting.
  - A data table displaying candidate details: `App ID`, `Application`, `Email`, `Skills`, `Apply Date`, and `Status`.
  - Action buttons: `Refresh`, `Accept`, `Reject`, and `Exit` $\rightarrow$.

4 Administrator Workspace

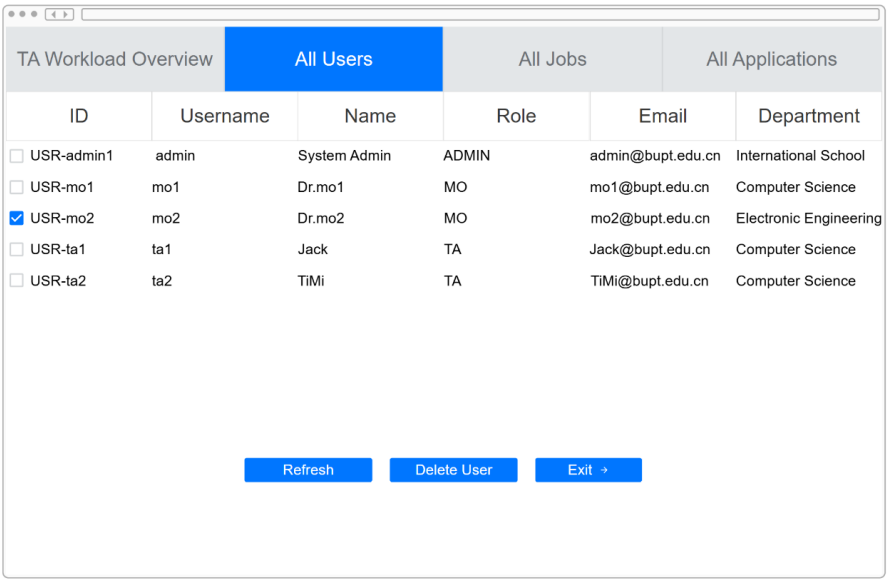
The Admin dashboard focuses on high-level system oversight and user management.

4.1 TA Workload Overview Tab



- **Purpose:** Allows the system administrator to check the overall workload of all teaching assistants to ensure fairness and prevent burnout.
- **UI Elements:**
  - A data table showing `TA ID`, `Name`, `Email`, `Department`, `Skills`, `Accepted Jobs`, and `Pending Apps`.
  - Action buttons: `Refresh`, `View TA Details`, and `Exit` →.

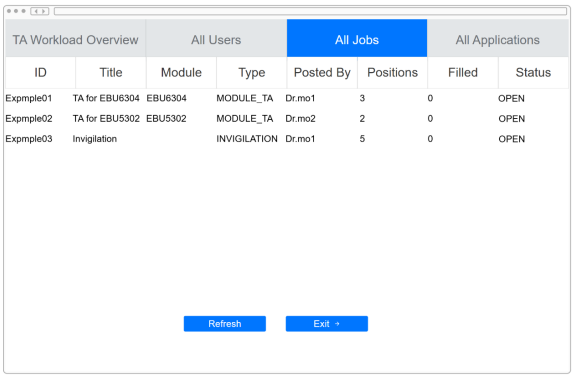
4.2 All Users Tab

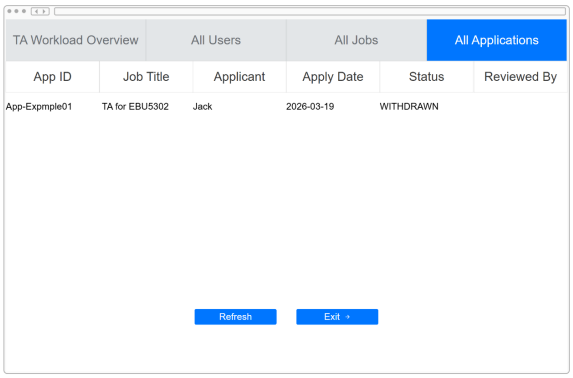


- **Purpose:** System administration for account management.
- **UI Elements:**
  - A comprehensive list of all registered users across all roles (`ID`, `Username`, `Name`, `Role`, `Email`, `Department`).
  - Action buttons: `Refresh`, `Delete User`, and `Exit` →.

4.3 All Jobs & All Applications Tabs

- **Purpose:** Global viewing capabilities for all activities occurring within the recruitment system.
- **UI Elements:** Similar data tables aggregating all global job postings and applications. (Note: These tabs are visible in the navigation but share the same structural logic as the previous data grids).





5 Agile & Prototyping Context

As an Agile development team of six students , we approached the prototyping phase by focusing on the logical user-interface design to establish the core navigation and interactions. To meet the first assessment requirement of submitting a prototype , we opted for a medium-fidelity design.

This decision allowed us to effectively visualize our selected user stories without over-investing time in high-fidelity aesthetics. By keeping the design simple and modular , we were able to quickly iterate on the layout, ensuring that the fundamental needs of the teaching assistants, module organisers, and administrators were clearly addressed before moving into the implementation phase. Ultimately, this medium-fidelity prototype serves as a concrete foundation for our upcoming Sprints, enabling continuous feedback and reflective improvement.
